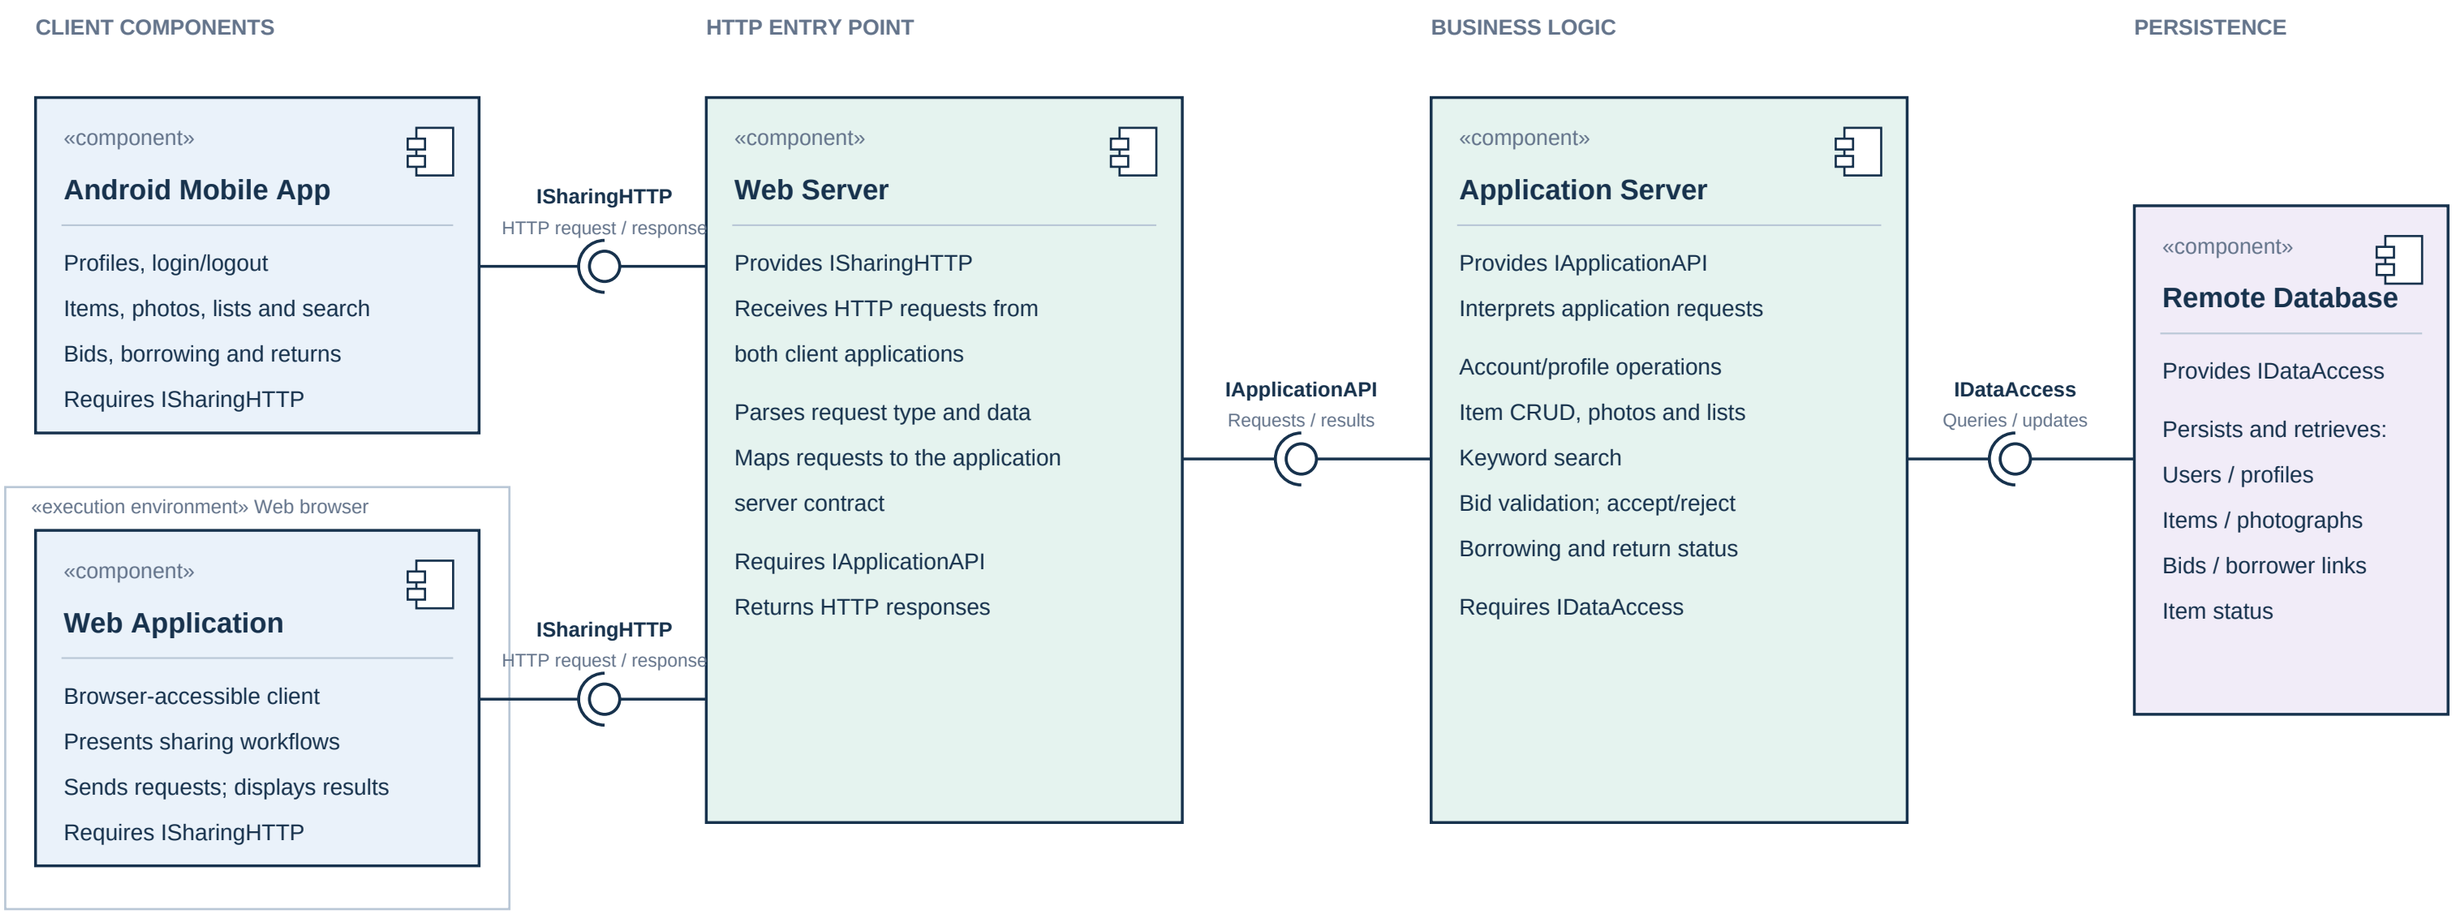
SharingApp | UML Component Diagram

Target architecture: shared remote database for Android and web clients

Fariza Arstanbek

29 October 2026



INTERFACE CONTRACTS

ISharingHTTP	Provided by Web Server; required by both clients. Carries account/profile, item, search, bid and lending requests and responses.
IApplicationAPI	Provided by Application Server; required by Web Server. Accepts parsed operation type, arguments and user context; returns results/errors.
IDataAccess	Provided by Remote Database; required by Application Server. Supports data retrieval and updates for users, items, bids and lending state.

NOTATION — Required interface (socket) — Provided interface (lollipop) — Solid connection = UML assembly connector

Scope: the supplied Android code stores data locally using Gson and files. This diagram intentionally replaces that persistence with the remote architecture required by the assignment. No client connects directly to the database.

Basis: Capstone 3 User Stories (US 1-21) and the assignment server/request description. Interface names and web-client internals are modeling choices; no database vendor, server framework or wire-data format is prescribed.
