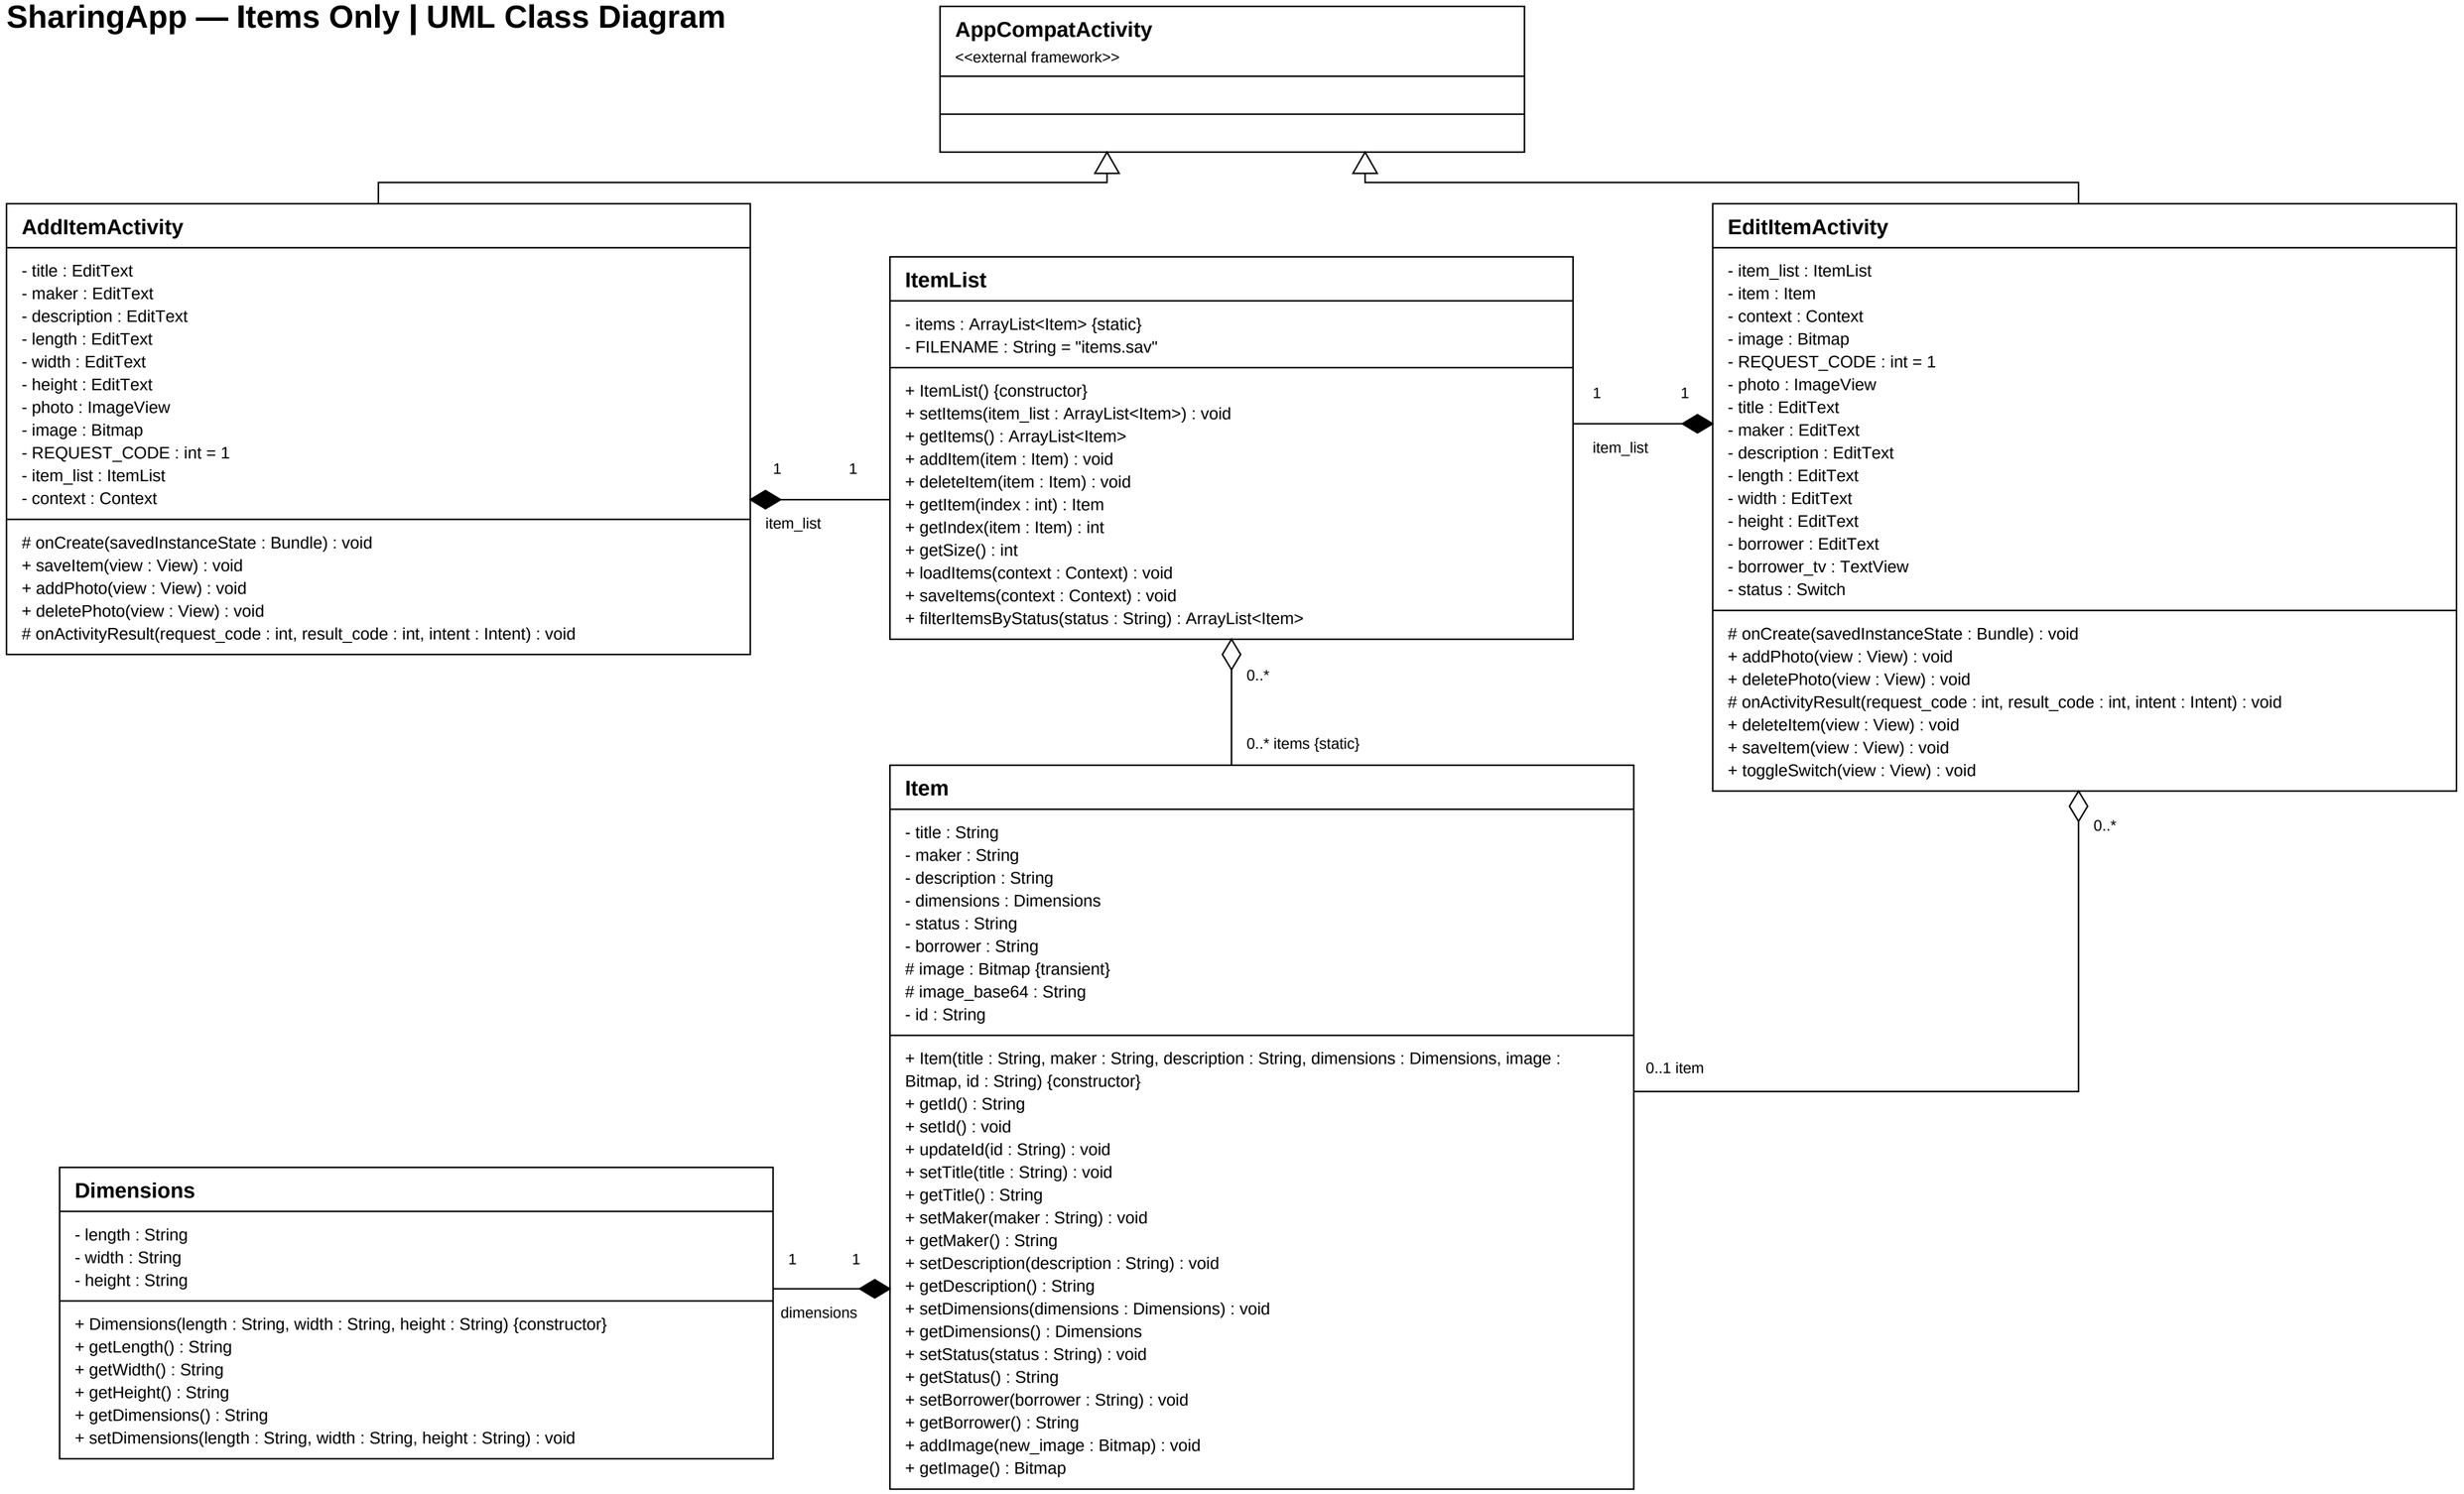
SharingApp — Items Only | UML Class Diagram



Notation: + public; - private; # protected. {static} denotes a class-level field; {transient} denotes a Java transient field.

Hollow triangle = inheritance. Hollow diamond = aggregation. Filled diamond = composition. Diamonds are drawn at the whole/owner end.

Scope: all fields and explicitly declared constructors/methods of the five application classes are shown. AppCompatActivity is the AndroidX external superclass.

Ownership: activities create their ItemList wrappers; ItemList.items is shared static storage. Item objects are created separately and may be referenced by multiple lists/activities.

Dimensions is modeled as the Item value part (one per valid app item). Java setters/getters permit aliasing or null; exclusive ownership is a design assumption, not enforced by this code.

Activity item_list and dimensions relationships duplicate the typed attributes intentionally. Optional create dependencies, Android widget classes and implicit Java constructors are omitted.
